## Patent claims

## Particle-stabilised emulsions

- An emulsion of the water-in-oil (W/O) or oil-in-1. water (O/W) type, containing:
  - (phase A), containing one oil phase an substantially water-insoluble component optionally a plurality of substantially waterinsoluble components,
  - a water phase (phase B) which may optionally contain further water-soluble components, such organic compounds, salts or such alcohols, carboxylic acids or other compounds,
  - pyrogenic silica which is arranged at the oilwater interface and is partly silylated in a manner such that the content of non-silylated surface silanol groups on the silica surface is from not more than 95% to not less than 5% of the starting silica, equivalent to from 1.7 to 0.1 SiOH groups per nm<sup>2</sup> of silica surface, the dispersion fraction of the surface energy gamma-s-D is from 30 to 80  $mJ/m^2$  and the specific BET surface area has a value of from 30 to 500  $m^2/q$ ,
  - and optionally further substances, such as pigments or preservatives,

the emulsions having a mean particle size of the 30 disperse phase, i.e. a mean drop diameter, of from  $0.5 \mu m$  to  $500 \mu m$ , the emulsions having a low viscosity, low viscosity meaning that the emulsions have relative viscosities  $\eta_r$  in the range of from 1 to  $10^6$ , the relative viscosity being 35 defined as the quotient  $\eta_{\text{rel}} = \eta/\eta_0$  of the measured viscosity of the emulsion  $\eta$ , measured at 25°C and a shear rate  $D = 10 \text{ s}^{-1}$ , divided by the viscosity of the pure homogeneous phase  $\eta_0$ ,

5

and the relative viscosity  $\eta_{\text{rel}}$  of the emulsion obeys the formula  $\eta_{rel} = (1-\Phi/0.74)^{-([\eta]\cdot 0.74)}$ ,  $\Phi$  being the phase volume of the disperse phase and  $[\eta]$ being a form factor which is in a range of from 2.5 to 100 for the emulsions according to the invention.

- The emulsion as claimed in claim 1, characterized 2. in that it is stable to separation of the disperse 10 phase, i.e. it is stable to creaming or sedimentation of the disperse phase, stable to separation meaning that the volume of the phase depleted in dispersion is less than 10% of the total volume.
- 3. 15 A process for the preparation of the emulsion as claimed in either of claims 1 and 2, characterized that a highly concentrated finely dispersion of the corresponding silica in the liquid which forms the homogeneous phase in the 20 emulsion is prepared in a first step, and a highly viscous preemulsion which comprises the total amount of the disperse phase and the highly concentrated finely divided dispersion of the silica, prepared in the first step, in the liquid 25 which forms the homogeneous phase in the emulsion according to the invention is prepared in a second step, the volume of dispersion used being such that the total amount of the silica required is present, and the remaining homogeneous phase being 30 slowly metered in in a third step.
- The use of the emulsion as claimed in claim 1 or 24. coating materials, adhesives and sealants, emulsions for cosmetic and pharmaceutical applica-35 tions, cleaning and cleansing agents or applications for changing the interfacial properties of liquid substrates, solid and such as repellents, adhesion promoters, release agents,

paper coatings or foam control agents and for the preparation of W/O/W or O/W/O multiple emulsions as control release systems or for the segregation of inert and reactive substances.

5

- 5. A coating material, adhesive or sealant which contains an emulsion as claimed in claim 1 or 2.
- A cleaning or cleansing agent which contains an 10 emulsion as claimed in claim 1 or 2.
  - A water repellent, adhesion promoter, release 7. agent, paper coating or foam control agent which contains an emulsion as claimed in claim 1 or 2.

15

- 8. A W/O/W or O/W/O multiple emulsion which contains an emulsion as claimed in claim 1 or 2.
- 9. A stability analyzer, characterized in that it 20 comprises a flat-bed scanner having a sample holder for holding measuring cells perpendicularly the scanner lamp, a tilted mirror which deflects the light of the scanner lamp laterally onto the measuring cells, and an evaluation 25 apparatus for evaluating the light received.
